Subject: Oxbow Hill Solar Project

Supervisor Jones,

Our cultural Resource consultant, Environmental Design & Research (EDR), will be conducting an archaeological field survey of the Project Area (consisting of our leased parcels) beginning on July 17, 2023 and lasting 3-4 weeks. The surveys will be undertaken by 2-3 crews. Each crew will consist of three to seven archaeologists, wearing high visibility safety vests. The majority of fieldwork will be conducted using shovel tests. The shovel tests will consist of small 30-50 cm diameter holes excavated by hand (i.e., with a shovel) to depths of approximately 20 inches. If any shovel tests are excavated in hay fields, pastures, or lawns, sod caps will be removed in one piece and set to the side while excavation proceeds. In crop fields, shovel tests will be excavated between rows so as not to disturb crops or planted seeds. All holes will be backfilled immediately upon completion, and the sod cap (if present) placed back on top of the backfilled hole. If there is sufficient ground-surface

visibility to comply with state guidelines, walkover surveys will be conducted.

Please feel free to consult with me if you have any questions.
